

python

```
1  class Solution:
2      def twoSum(self, numbers: List[int], target: int) -> List[int]:
3          left=0
4          right=len(numbers)-1
5          while left<right:
6              guess=numbers[right]+numbers[left]
7              if guess==target:
8                  return [left+1,right+1]
9              if guess>target:
10                 right=right-1
11             if guess<target:
12                 left=left+1
13         return []
```

就，正常缩进就行，没必要纠结精确
